IF IT'S 232-DRUG, IT HEAVY!!!

Drugs (T.H.)

This rag is dedicated to the propagandizing of the clandestine efforts

of the DRUG CRISIS CENTER

THE FIRST TOKE

232-DRUG has been around for over two years now. We've worked and we've dreamed and then worked some more.

And through it all, we've remained pretty secretive, mostly due to narks and other weird people.

Lately though, the move has been to open up a bit. We have information that you might be able to benefit from, yet some people, we are told, are afraid to call up, due to possible phone taps, etc. We have shortcomings also, and problems, which could be understood and overcome with a little communication.

Take a toke.

There's all kinds of shit here. Hope you can get off on some of it.

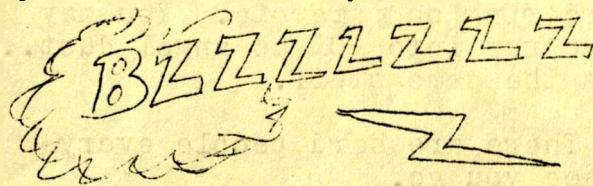

&&&&&&&&&&

ANALYSIS on the back

MESCALINE! THC! on the back

NEW TIMES.....

We're gonna be closed from 9 AM to 4 PM daily.

Community Affairs File

NEW HOURS

In the past we have advertized as a twenty-four hour hotline. You could probably tell us otherwise. We started out as a 24-hour deal, but at times, such as in the morning, on week-ends, holidays and vacations, its hard to keep people around.

In the past we've tried to solve this with the use of an automatic secretary. If you ever called and got this, you were either given another phone number or told that nobody was here and to call the hospital (number given in case of medical emergencies).

This solution seems to have caused its own problems, as most solutions do. The tapes never got put on, so the phone just rang. Or nobody was home at the referred number.

The most hassle seems to be with the nobody home tape though. St. Anthony's or Union don't deal with people the same way we do. The phone receptionist rarely knows much about medicine, let alone what kind of dope is in town what's bad, etc. The hospitals don't do drug identifications and they rarely will sit down and rap with you. They're into medical emergencies. They're also subject to some nifty state laws, mostly dealing with people underage 18...

Vigo County Public Library

REFERENCE
DO NOT CIRCULATE

New Times. ;

Anyway....what we are trying to do is rearrange our schedule so that the automatic secretary can be put to pasture.

The finally arrived at plan is to shut down between about 9:00 in the morning, til about 4:00 in the afternoon. Historically this is the deadest time slot of every day. Its also the hardest time to fill, because much of our staff goes to school then.

When we get people who will work these times and who don't mind being bored to death, we'll reopen.

But until then, the phone will not be manned from 9 in the morning til 4 in the afternoon.

~~~~~

#### ANALYSIS

There is some coke in town that was making people sick. The analysis did not turn up any signs of strychnine or belladonna. The final determination was that the stuff was almost pure. Cocaine does have a nauseous side effect especially if you do too much.

In the way of preventative analysis, we tested some strawberry/pink/purple barrel acid. It tested out to be junk acid, with alot of the lysergicamine byproducts in with the LSD. These amines and other chemicals are the cause of much of the speedy and strychnine reactions in street acid these days. Actual speed or strychnine in acid is pretty rare any more.

In the past few months, acid, junk acid, and acid cut with a down (sometimes barbiturates, and once opium) has been parading about as MESCALINE. In almost all cases the stuff has been in pink gelatin caps, and either white,

light blue, or deep purple in color. (Incidently the Purple concert in Nap was pretty heavy)

Only once did the stuff tested contain any mescaline, and then there wasn't enough to get off on.

Although neither have been chemically analysed, the pink microdot and the 'green giant' blotter acid seem to be fairly pure.

MESCALINE! THC!

'Hey, man. Got some really nice organic mesc. Buck a hit.'

'I don't know. That last stuff was awful heavy for mesc. TOKE said it was really acid.'

'This is new stuff though. No shit! Tried it myself. It has to be mesc. Organic, too!!!'

'Well....'

That scene goes on every day, every hour probably, somewhere in our fair land. The fact is mescaline, organic or otherwise is pretty rare--in a big city with good connections. Now Terre Haute....

THC is the same. THC is not the active ingredient to marijuana. It is only similar to many of the over eighty alkaloids found in grass. THC is easier to synthesis than other alkaloids (if you have a lot of money) and thus it is freely substituted by the government in research.

THC is usually PCP or PCP and LSD together. PCP is an animal tranquillizer, with mildly hallucinogenic properties, usually bordering on paranoia. You may have run into PCP as angel dust... Its the same stuff.

There are hard people every place you go.

DRUG  
ANALYSIS  
REPORTS

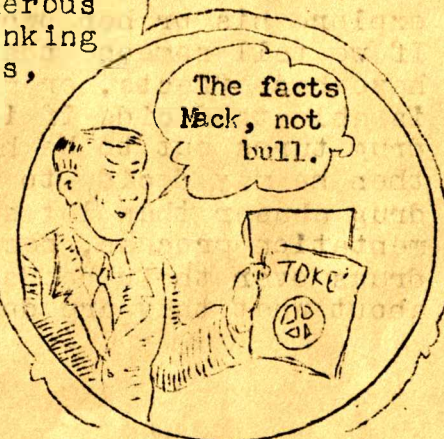

Sopor M adness

O nobly born, you may be experiencing sensations of dizziness, looseness, tingling in the extremities, disconnection, fatigue. This is because you have taken the drug Methaqualone. At this time you are being set face to face with the Dim Light. Flow with it. What the fuck, slash around in it. Wave your hand around and watch it follow itself. Whatever. Only, o nobly born, don't try anything dangerous like driving a car, drinking a beer or, in some cases, standing up.

# WALKING THE LINE

## AN EDITORIAL ABOUT OUR NEUTRALITY POLICY

Reprinted from an  
earlier issue of  
"TOKE"

by Tom Raubuck  
Junior Director, 232-DRUG

It seems that we are always in a state of limbo as to where we lie in the public sentiment. The Drug Crisis Center always seems to be walking a rather precarious tight-rope; on one side rests the so-called "head" community, and on the other rests the so-called "straight community. Seemingly, if we do something that one group approves of, the other takes offense.

The point of this editorial is to explain and defend our policy of neutrality about drug usage. To be neutral, according to Webster's Dictionary, means "...not to be engaged on either side; specifically not aligned with a political or ideological grouping." To put it another way, the usage of drugs is your own personal decision, and we feel that you could make a more intelligent decision if you have some factual knowledge about what you may be getting into. So the Drug Crisis Center as a collective body is neither for nor against drug usage; we just want you to have the straight facts with as little value judgment on our part as possible. We believe that you are capable of making your own decisions about how to run your life. Anyway, in any case it is you that must live with the consequences of your actions.

Many of our critics see this as condoning drug usage. It's easy to see how someone could misinterpret it that way. To our critics I will reply that we base our policy on our own personal experiences and on statistics that prove that telling people that drugs are bad is simply a waste of time. Do people stop smoking because of the danger of lung cancer, or stop drinking because of the possibility of cirrhosis of the liver? (Not to mention the danger of addiction?)

We have found that the best we can do is to present the facts and let each one decide for himself. We can help a potential user explore his or her own feelings and let them weigh the data at hand. If we tell someone that a drug is potentially dangerous and may have bad effects, or might even cause death, we assume that he/she is able to decide if it is worth the risk. On the other hand, if a drug turns out to be harmless (and few are, especially street drugs), then he may decide to take it. I would rather see an educated drug abuser than let someone harm or kill himself by the experimentation process, because I know that many people who get into drugs over their heads do so simply because of lack of knowledge about what they are doing.

# QUAALUDE/\$OPORS

## HEROIN FOR LOVERS

Reprinted from "VIBRATIONS"

Drug Survival News \*\* Which is published by the DO IT NOW FOUNDATION

**QUAALUDE: A REAL DOWN**  
NEW YORK (LNS) \*\* "Patients awoke refreshed without hang-over, drowsiness, headache or other side effects. Patients are alert, immediately fit for Quaalude, one of the most widely used non-barbiturate hypnotic drugs available in the U.S. today.

Methaqualone, better known by its brand name, Quaalude & Sopors is not only widely distributed by psychiatrists and physicians as a sleeping pill and sedative, but is also becoming one of the most popular street downs. It has also been flooding the college campuses.

Many Quaaludes appeared in Miami this summer where large numbers of people have gathered to demonstrate at National Conventions. Quaaludes are taken regularly by some and experimented with by others -- but almost always without knowledge of the dangers involved.

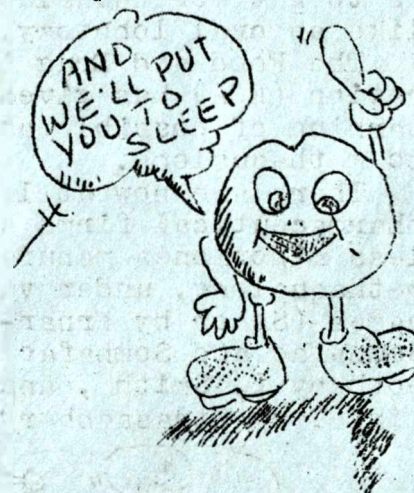

What has made this drug particularly attractive was that it was thought to produce a non-addictive "buzz" and thus a safe replacement for addictive barbiturates and heroin. Quaalude is often referred to as "intellectual heroin."

But methaqualone is highly addictive too.

There were good reasons for people to believe methaqualone to be non-addicting. Even most doctors will tell you that there was essentially none or little evidence in medical or pharmacological literature to indicate any serious addicting potential.

A major source of information for a wide majority of practicing physicians, the Physicians Desk Reference, has not indicated any serious likelihood of addiction. And no wonder; the PDR is published by a consortium of drug firms and is designed to push their products and not to discourage doctors from using drugs.

But even the PDR states, "Due to lack of long term experimental data, Quaalude should not be prescribed for more than 3 months." And, "Care should be used during administration with other analgesics, sedatives, psychotherapeutic drugs or with alcohol because of possible potentiation of effects." Which is to say, that if you take quaalude with wine or seconal, or any other downs, it may become 2 to 10 times as strong and dangerous -- it only takes the strength of 20 quaaludes to kill a person.

CONTINUED ON PAGE 4

# HEROIN FOR LOVERS

The dangers for those who use quaaludes (and or sopors) infrequently or alternately with other drugs (speed or other downs such as seconal, tainol, ect.) are the side effects of dizziness, hangovers and the yet untested damage it does to bone marrow and stomach lining. And there is also the damage than any drug intake does to the liver which has the job of filtering the impurities out of the blood.

For the addict the problem is much worse.

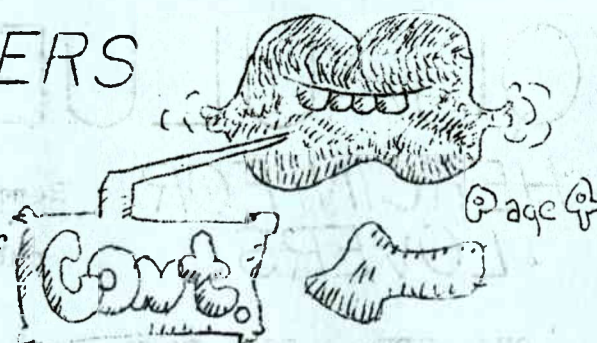

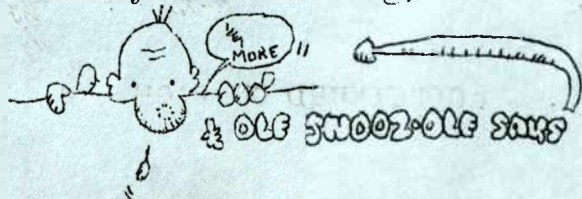

## ADDICTION

"I have seen quaalude addicts who can't speak straight. They repeat sentences over and over and don't even know what they've said," observed one woman whose sister is a quaalude addict. "You have to repeat things to them and then they still don't understand. Once when I was talking to one woman who takes them regularly, 1200 mgs. or more a day, her eyes kept rolling back into her head. She nodded out on the bed."

It's disgusting. But the worst part is the hopelessness she feels. Her only motivation is to get more quaaludes. It's like an oral lobotomy."

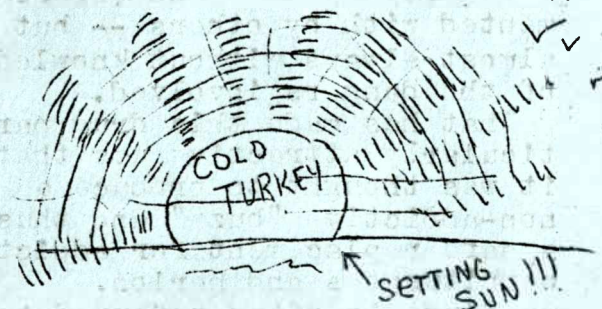

The Food and Drug Administration (FDA) has given no serious warning of possible addiction to methaqualone.

There are now at least 7 major pharmaceutical firms and countless minor ones manufacturing methaqualone, under various names (Sopor by Arnar-Stone, Somnafac and Somnafac Forte both by L. Smith, and Bipheta-mine T by Strassenberg).

These companies manufacture far more tablets than can be used safely in prescribed medical situations. Not surprisingly there is wide-spread quaalude diffusion, legal and otherwise, through physicians' prescriptions, stealing from factories and warehouses, hijacking from trucks are in all likelihood, some underground laboratories. Methaqualone is flooding the street and is readily available even if at comparatively low prices.

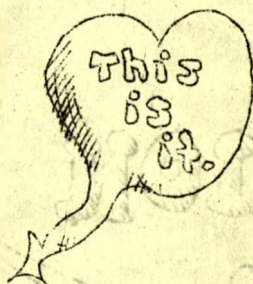

But the biggest problem with quaalude, is that while it is addictive -- though not as addictive as herion -- a person addicted to quaalude cannot withdraw by going "cold turkey" as he or she can with herion.

Why not? Going cold turkey from quaalude can produce convulsions, stomach hemorrhaging and death. (Herion does none of these except through overdose). What makes this problem doubly hazardous is that since few people know methaqualone is addictive, most users of the drug are unaware of its withdrawal dangers.

Continued ... ON PAGE 5

## HEROIN FOR LOVERS CONT'

Drug Help in Ann Arbor has had a few methaqualone addicts come to them for help. All have said that they took quaalude in place of or in avoidance of addicting drugs. "Unfortunately, when we attempted to get these hospitalized for detoxification, all of the hospitals in the area said they would take no addict of any description and insisted that the problem was a psychological one and not a medical one. We were requesting hospital admission for medical detoxification and supervision and not psychotherapy, says Richard Kunes of the Drug Help Center.

The pharmaceutical firms', the FDA's and BNDD's failure to report and emphasize the addicting nature and potentially fatal convulsions of acute withdrawal of quaalude have made the drug more dangerous than barbiturates..

As with alcoholics and other addicts, there is no place to go for detoxification. "For every quaalude addict we come across, that addict seems to know 5 or 6 others. At this point we believe we are only seeing the tip of the quaalude addict iceberg," says Kunes.

## Withdrawal

There is one common method of medically supervised withdrawal from methaqualone addiction. That is to place the patient-addict in an in-patient service, put him/her on a 24 hour convulsion precautions, stop all quaalude intake and

PAGE 5 of "Toke"

immediately re-addict the patient with high doses of barbiturates as a substitute for quaalude. Since withdrawal from barbiturates is standardized procedure, once the patient is addicted to barbs, withdrawal from them is begun and completed in a 4 to 6 day procedure.

In an attempt to warn drug using public and particularly unknowingly potential quaalude addicts, Ann Arbor Drug Help has placed articles and ads in all the local newspapers both "straight" and underground, emphasizing the dangers of "cold turkey" withdrawal and the necessity of seeking medical supervision for withdrawal. But because virtually all forms of drug education in the past years have exaggerated the dangers of drug use, such as the anti-marijuana campaigns, it is unlikely for some time that Drug Help's information about quaalude will be believed.

## A REPORT ON QUAALUDES AND OTHER METHAQUALONE DRUGS

by Joe Axtou

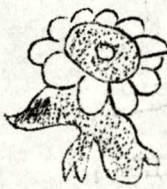

Methaqualone (known on the street as sopors or Quaalude) has been the blue-chip stock of both the underground and above ground drug industries since late 1970. This chemical has become so abundant and is creating such hassles in college, high school and underground communities that you rarely find an underground newspaper not running regular warnings on the dangers of sopors. A great deal of the credit for methaqualone's popularity must go to its manufacturers for promoting it as completely "safe and non-addictive". Sort of a "fun aspirin" image. That this claim is, in fact, not true must be in no way taken as a reason for doubting the credibility of drug manufacturers; rather only as an indication of the sometimes unrestrainable enthusiasm of their promotion departments and a corresponding lack of enthusiasm on the part of the individual drug companies' research and testing departments. That methaqualone has been in use and recognized as addictive in other countries for a number of years (surveys in Japan showed that half the drug addicts in Japanese hospitals between 1963 and 1967 were methaqualone addicts) might have been an easy

thing to overlook when the Rorer drug firm started promoting the first American brand of methaqualone (Quaalude) in 1965. That they and the half-a-dozen or so American drug firms who've since jumped into the booming methaqualone business still advertize that "physical dependence has not been clearly indicated" can be only judged an acute case of over-Optimism.

Methaqualone is marketed as a non-barbiturate, hypnotic-sedative. Doctors prescribe it as a sleeping pill or tranquilizer. Enthusiasts describe its effects as resembling a heavy tranquilizer with a little extra euphoria thrown in. It relaxes the user to the point where walking straight and talking clearly become a chore. It releases inhibitions. It lightens your head and body and makes you feel warm and friendly, affable and extremely witty. It can make an otherwise dull group of acquaintances seem to turn into sparkling bosom-buddies. (Its relaxing and inhibition-releasing qualities are probably why many users attribute aphrodisiacal properties to the drug.) After awhile it makes you nod out.

Continued

Page 7

A report on  
**QUAALUDE**  
cont'...

The effects of methaqualone are very pleasurable, obviously, or they wouldn't be so popular. Unfortunately, like so many pleasurable things, they can also be very dangerous -- especially so if you've been led to believe otherwise, or are just not aware of the dangers. It's your head and your body. It's up to you what you want to do with them, but they don't come supplied with replacement parts so be aware of what you're putting into yourself. There are a lot of chemicals happening out there -- some pleasurable, some beneficial, some destructive, but mostly varying combinations of all three. Be picky.

The current heavy street use of methaqualone has shown it to be psychologically and physically addicting. Prolonged use builds a physical tolerance for the drug and produces heavy withdrawal symptoms when its use is discontinued. Methaqualone has a lot in common with its brother-downs, the barbiturates, and can be even more dangerous in some respects.

\*-- Unlike hard narcotics, the amount of methaqualone needed for an overdose does not increase correspondingly with a user's tolerance, so that while it takes increasing amounts to attain the same degree of stonedness, the amount it takes to overdose remains the same. Eventually heavy users will get to the point where they overdose before they get off.

-- Like barbiturates, methaqualone is potentiated by alcohol, meaning that mixing the two will result in the multiplication of each.

page 7  
Which means a lot if you wish to avoid overdosing yourself. Most methaqualone-related deaths are the result of drug overdoses mixed with alcohol.

-- Like barbiturates, withdrawal from a long run of methaqualone can be deadly and should never be attempted without medical supervision. Heroin withdrawal involves heavy cramps and a sickness similar to the World's Worst case of the flu; barbs and methaqualone go a step further by adding potentially fatal convulsions. Initial withdrawal signs are headaches and severe cramps, followed by convulsions and stomach hemorrhaging three to five days after discontinuing use of the drug.

The most common current hospital method of methaqualone withdrawal is to substitute a high dosage of barbiturates for the methaqualone and then proceed with a gradual withdrawal from the barb. You can expect a number of very psychologically-grey days after quitting a methaqualone run.

Some people just don't get along with some chemicals. When taken by prescription your doctor will figure these things out for you, but on the street you have to figure it out for yourself. Adverse reactions to methaqualone may include dizziness, headache, hangover, torpor, restlessness, anxiety, dry mouth, loss of appetite, nausea, vomiting, diarrhea, sweating, foul smelling perspiration, skin eruption, rashes, and/or burning sensations. If some of these symptoms occur there's not a thing you can do about it, except stop taking the drug.

## NIXON'S HEROIN HOTLINE

Information for this article  
compiled by Tom Raubuck

Last April 7, President  
Nixon launched a new Operation  
Intercept. This one modeled  
on local "Turn in a Pusher"  
programs, was started by the  
Office of Drug Abuse Law  
Enforcement as part of the  
President's "all out war on  
drug abuse."

"If I were the president  
of this land I'd declare  
total war on the pusher  
man."---

You can call the Hotline  
collect (toll free) 24 hours  
a day (800-368-5363) to  
report anyone you suspect of  
trafficking dangerous drugs.  
The information is recorded  
by "trained operators" and  
relayed to investigators in  
41 states who "carefully  
asses these anonymous tips.

The Heroin Hotline, in  
spite of its flashy premise,  
has not exactly caught fire.  
The government reported that  
between April and the end of  
July they received 33,313  
calls.

Continued on page 10

"Funny," said another observer, "how easy it was to get Quaaludes at the Republican Convention last summer. You'd almost think someone wanted us all to be asleep or numbing around the streets like a bunch of zombies."

"The more sacramental herb that we smoked with our brothers and sisters, the more we realized that we could no longer be a part of the honkoid, plastic Amerikan death culture that we had grown up in. It was marijuana and psychedelics that began to cleanse us of the pig inside ourselves, bringing us more in tune with nature and gave us visions of a whole new economic, cultural, and political social order based on communalism, where all people can live in peace and develop to their highest human potential."

"But the capitalist ruling class that runs Amerika couldn't stand to let this upsurge of freedom go unchecked.

"DOPE AND POLITICS....

"What better way to diffuse the peoples energy and to keep them under control? If people are nodding out they are not going to be spending much time or energy in building the alternatives that are necessary for us to survive and grow as a people."

Apparently Mike is not alone in his ideas about government control, by using drugs. In other parts of the country where quaaludes and sopors are even more prevalent large campaigns have been started by such notables as Jerry Rubin and Abbie Hoffman. Rubin himself called the infiltration of "ludes", into the counter culture, "an attempt (by the powers that be) to destroy any spark of revolution left in us."

Thanx, to the many people who have helped me find material on methaqualone. Specifically Genevive Risner who works in Group Service's at Emeline Fairbanks Library (Vigo County) and Todd Layfield who runs our library.

Information from "Grassroots", "Ann Arbor Sun", "Rolling Stone", and "New Day" was used for this article.

## HEROIN HOTLINE CONTINUED from page 9

Of these the government reported that 28,079 of them were obscene phone call, heavy breathers (pant, pant) and other cranks.

Of the rest, only 113 were deemed serious enough to warrant immediate investigation, and the investigations led to the seizure of 4½ kilos of marijuana, 3,300 tabs of LSD, two grams of heroin and two guns.

Through July 31, the hotline has cost tax payers about \$260,000 plus \$125,000 for advertising. Nevertheless, Nixon isn't calling it quits and continues to insist that the idea is a major weapon in the fight against drugs.

Keep them calls coming folks.

# Sopor Madness

## THE METHAQUALONE BOOM

Information for this article compiled by Tom Raubuck

---

During my research for material about Methaqualone (i.e. Sopor and Quaaludes ect.), I ran across many little known facts that we haven't printed. In this article I will be bringing to you some of this information. It's yours do with it what you will.

### TAKING A SLEEPING DOSE OF METHAQUALONE, THEN RUNNING AROUND DOING THINGS.....

Specifically relaxed to the drooping point; comfortable (the pain threshold is higher), confident, and sequently uninhibited, communicative and generous.

You'll also be unable to coordinate your muscles very well, or tell where limbs exactly are, when undertaking tricky tasks such as walking; you'll understand the meaning of the term "wallbanger." Your eyes may play ping-pong a little in their sockets. But none of this will matter much to you. People who have taken enough "quacks" can fall down flights of stairs and not feel the bruises until the next day.

On higher doses the effects are more pronounced. Coordination becomes very difficult due to muscular tremors, which it has been suspected are actually symptoms of partial anaesthesia of the muscles. An acute overdose 2.4 grams (say, eight 300 mg. tabs) can result in coma and convulsions. Death has followed a dose of as low as 8 grams. A dose higher than the sleeping dose can depress tracheo-bronchial reflexes to a dangerous degree so that if you were to vomit in your sleep, you could choke to death, Jimi Hendrix style.

Note: Rock and roll has already seen its first methaqualone OD: Danny Whitten, formerly of Crazy Horse.

### METHAQUALONE ALL AROUND US.....

The dangers of addiction and poisoning have been recognized in other countries, among them Britain, where methaqualone was included in the Drug Prevention of Misuse Act of 1971. Earlier than that, half the drug addicts in Japanese hospitals in the mid-sixties were on quaalude.

"We had Quaalude here in the Haight briefly in '68," says Dr. Gay." Then it fades, probably because of the smack epidemic, in '68 and '69 there was a lot of, up-down scene, following the big speed era. The bikers moved into the Street and brought their own street pharmacology for easing the comedown from speed. They'd take barbs or smack after a couple of day's speed run. Then in '71 the Bureau of Narcotics and Dangerous Drugs started scheduling drugs, and barbs began to get harder to get -- though of course there are still twice as many barbs manufactured as are sold by prescription.

Mike Minnich, from the Tribal Council Drugs Committee in an article for the Ann Arbor Sun says; "when our culture first began to develop, marijuana and psychedelics were an integral part of our development as a people.

# Dr. Phil's

## ACID/L.S.D.

## REPORTS

### MR. NATURAL BLOTTER ACID

Description: Picture of Bob Crumb's Mr. Natural "gritten" his teeth and "twiddlen" his thumbs. Printed in purple ink on white blotter paper with a red water mark with the hit of acid in it.

Comments: Good Acid. No noteable impurities. Not too strong on one hit you'll most likely get a mild trip, unless there is a big difference in each hit.

### FAMILY BLOTTER ACID

Description: Another of Bob Crumb's cartoons. Family of 6 with one kid "bawlin" his brains out. Another tyke has his hat turned sideways. This is also printed in purple ink on white blotter paper.

Has a light pink or red water mark where the hit of acid is at.

Comments: Good Acid. About the same as the Mr. Natural except the amount of acid wasn't as much. Which may prove the theory of the amount of acid in each hit being different. (it would be pretty hard to get the amount the same) At anyrate the analyst says they are okay and won't hurt you.

### Orange Acid

Description: Tablet maybe about 3/8 inch in size, orange in color  
Comments: Weak acid.

### MESCALINE

#### FOR REAL

#### LAVENDER MESC.

Description: Light purple or lavender powder with red, yellow and green and dark purple specks (multi-colored) Being sold in bulk, both clear and pink capsules.

Comments: Excellent. Apparently made by someone who really knows what he's doing. Contains Mescaline and Canabinolic Acid. The latter (which I may have misspelled) is one of the main derivatives of marijuana. Meaning one of the main chemicals included (like THC) in Grass. Anyway they potentiate each other making the whole effect stronger. Thus one hit may be a little more than enough for the inexperienced tripper. Strong stuff.

# WALKING THE Cont' LINE ON NEUTRALITY

This is an editorial and contains my own feelings as I reflect on our official center policy. Others on the staff might express their feelings differently. Anyone wishing to reply either for or against what I have written here may do so by writing 232-Drug Crisis Center, Inc., 714 Mulberry St., Terre Haute, Indiana. If you would like to have your answer printed in a subsequent issue of "TOKE" you must include your name and address (which we will withhold from printing at your request).

## DRUG ANALYSIS REPORTS CONTINUED FROM PAGE 11

### GENUINE TRIPPING WEED

TAKE NOTE OF THIS ONE FOLKS IT  
MAY BE A LITTLE TOO MUCH TO HANDLE

Description: Grass which has a lot of gold color to it. Could possibly be palmed off as the legendary "Alcapulco Gold". But it is not. What grass is not tinted with the gold color is a somewhat light green. Nothing noticeable seems to come off on your hands, that is like a powder.

Comments: This grass put one guy on a wild hallucinogenic trip for over a day and a half. The grass has been treated with a crude mescaline extract and LSD. These drugs all potentiate each other a like quadruple the strength. VERY, VERY, STRONG. Note another guy smoked a joint of this stuff and went on the wildest trip he's ever been on lasting several hours. (NOTE: the guy who had been tripping for a day and a half had only smoked this stuff once at the beginning of the trip.)

↑ UPS (SPEED) Page 12

Description: Large white tab 3/8" or a little larger. Has a line scored on one side like an x (note ill.) edges slightly beveled, has a good case on it looks so perfect you'd swear that it was made by a pharmaceutical firm.

Comments: Is  actually a pretty good grade of methamphetamine. No noticeable impurities.

Description: Since this was brought in, in several chunks it's hard to be accurate. Possibly about the same size as the other pill, maybe aspirin sized. But only had one line scored across it.

Comments: Methamphetamine also. No noticeable impurities.

### ↓ DOWNS (BARBS)

We'll reprint this because we are still getting a lot of calls on them.

Description: Small white pill. somewhat bevelled edges. Has some ruffness to it because the pill compressor has an imperfection. Little larger than a sacharin tablet.

Comments: Strong phenobarbital which is supposedly being sold in large quantities. (Lot of it around) Phenobarbital is a long lasting barbiturate. Note; this is street made stuff. No noticeable harmful impurities. But because of its strength go easy on the amount you take. Some people have told us that taking over 4 or 5 will knock you out.
